| Allocation | Co-product allocation was applied for the brass scrap that is produced from the foundry process. Economic co-product allocation was applied based on the hierarchy presented for co-product allocation on the EN 15804:2012+A2:2019. |
| Electricity used in module A3 | The electricity used in module A3 accounts for more than 30 % of the total energy consumption in modules A1-A3. Therefore, the used energy sources for electricity production and climate change impact of the electricity mix are stated. The electricity is 100 % based on hydropower. GWP-GHG impact of the used electricity mix is 5,4 g CO ₂ -eq/kWh. |
| Information about scenarios and additional technical information | The scenario for operational water use is described on chapter "Additional Information". |

Modules explained

| LCA Modules | |
|---|--|
| A1 Raw material supply | C1 De-construction |
| This module contains the supply of raw materials including brass, stainless steel, plastics, rubbers and other materials in smaller quantities. | This module is assumed to not cause environmental impacts as the de-construction of faucet product can be done with manual labour and does not require external energy sources. |
| A2 Transportation | C2 Transport |
| This module contains the transportation of raw materials and prefabricated components from suppliers to Oras Group's production facilities. Average transportation route covering all the relevant raw materials was developed as there is wide range of possible supply locations even for single raw materials and components. Transportation takes place by road and sea. | This module contains the transportation of product for waste processing to nearest waste processing facility. Transportation is done by road and the distance is assumed to be 50 km. |
| A3 Manufacturing | C3 Waste processing |
| This module contains the relevant production processes for shower faucets. The most relevant processes are casting in foundry, production of plastic parts and chrome-plating of brass and plastic parts. Treatment of waste and wastewater are also included. The used electricity mix for manufacturing stage is stated on chapter "LCA Information". | This module contains the waste processing related to material recycling of brass. It is assumed that 90 % of the brass is headed for material recycling process, which includes casting of brass into brass ingots. |
| A4 Transport | C4 Disposal |
| This module contains the transportation of the final product to warehouses from where further distribution takes place. The scenario does not included transportation to construction site. | This module contains final disposal of materials that are not headed for material or energy recovery. Stainless steel, plastic components, rubber components, packaging materials of the final product and 10 % of brass are assumed to be headed for incineration without energy recovery. Other components in smaller quantities are assumed to be headed to landfill. |
| B7 Operational water use | D Benefits and loads beyond system boundary |
| This module contains the production, heating and wastewater treatment of tap water related to the use of shower faucet. The scenario for operational water use is described more precisely on chapter "Additional Information". | This module contains the benefits related to material recycling of brass. Brass is recycled through casting process, and it is assumed to substitute virgin brass production from the market |

Additional information

The scenario for module B7 "Operational water use" is based on Unified Water Label (UWL), which is a product label developed by European bathroom industry to demonstrate water and energy efficiency of bathroom products. The technical criteria of UWL correlates with existing European and National standards while establishing harmonised calculation criteria for bathroom products. The following parameters were applied when developing the scenario related to operational water use.

| Parameter | Amount | Unit |
|---------------------------|--------|----------------|
| Reference flow | 12 | l/min |
| Use cycles per day | 1 | use cycles/day |
| Length of use cycle | 7 | min |
| Use cycles per year | 365 | days |
| Cold water temperature | 15 | 0 ⁰ |
| Hot water temperature | 38 | ٥С |
| Heat coefficient of water | 4,18 | kJ/kgK |
| Density of water | 0,981 | kg/l |
| Length of the use stage | 10 | years |

The annual water consumption according to the parameters stated above is 30 660 l. It is assumed that 90 % of the water consumption for shower faucet is hot water. This means that 27 594 l of water is heated annually. 722,91 kWh of energy is consumed annually for the heating of water. The scenario for operational water use covers 10 years which is the reference service life of shower faucets. The energy profile for heating of water is based on Eurostat statistics describing disaggregated final energy consumption in households used for water heating in year 2018. The geographical coverage of the data is Europe (EU27). The following values were applied when modelling the energy profile for heating of domestic water.

Operational water use scenario

The scenario for operational water use covers the water and energy consumption related to use of shower faucet by one person for 10 years according to the calculation parameters described in UWL methodology. The scenario presented in this EPD is an estimation of the potential environmental impacts related to the use stage of faucet product and the scenario aims to emphasize the significance of the use stage in relation to the products life cycle. In reality, the environmental impacts arising from the use stage of the product are very dependent on behavior of the user, nominal flow of the faucet product and energy sources used for heating of domestic water.
